Name: Lead-list-builder

Description: Turns a one-sentence ICP into a clean, qualified lead list with emails, saved as a Google Sheet for downstream skills to use.

What this does

Takes an ICP sentence + Campaign Name, finds matching businesses via Apify's Google Maps Scraper, enriches with emails, cleans/dedupes, and saves the result as a findable Google Sheet.

Inputs needed

- ICP sentence (business type + location/radius)
- Campaign Name
- Company name + what it does (for labeling, since this is example data) Ask for any of these if missing.

Process

1. Extract business type + location/radius
2. Run Google Maps Scraper
3. Run email-finder on results with a website but no email
4. Remove duplicates
5. Remove entries with no website and no email
6. Flag named decision-maker vs generic inbox, sort accordingly
7. Save as "[Campaign Name] - Lead List" in The AGI Guide / Leads folder

If something breaks

- Few/no results → ask whether to broaden radius or change category
- High email-finder failure rate → report rate, ask how to proceed
- Missing destination folder → ask whether to create it

Done means

Clean, sorted, deduplicated table saved as a real file, findable by Campaign Name, ready for Outreach Drafter to pull automatically.
